

REELS AND COILS HANDLING TRUCKS

Reels and Coils Handling Trucks

Wide range of special forklifts equipped with specific equipment capable of handling, transporting and storing different types of reels both in diameter and material they are made of.

Different equipments are available such as:

Forks with prism profile or with folding sides specially sized and shaped according to the length and diameter of the reels to be handled.

Spikes (cylindrical single-fork tools) that allow you to position the load through the central hole. This prevents coils, of very delicate material, from deforming at the sides, crushing.

Gripper equipment to manipulate the reel by rotating it both frontally and laterally, bringing it from a vertical to a horizontal position, or possibly vice versa.
